Abstract not available for DE10064770

Abstract of corresponding document: [US2003000335](#)

A device is provided for mounting a pedal lever (1) of a motor vehicle, which is accommodated in a housing (3) pivotably around at least one said bearing element (2). At least one section of a separating wedge (5) is supported via a said support surface (4) against a motor vehicle component (7) and brings about the shearing off of the bearing element (2) due to the action of an external force caused by an accident due to a relative movement between the separating wedge (5) and the bearing element (2) by applying a shearing force. The separating wedge (5) is accommodated between a surface of the housing (3) and the bearing element (2).
